DETAILED ACTION

Allowable Subject Matter

Claims 1-17 are allowed.

The following is an examiner's statement of reasons for allowance: The non-sliding mode control prior art of record does not disclose or teach an actuator control apparatus having a first state amount that is made to converge on an equilibrium point on a first switching function stipulated by a first linear function which takes as a variable the first state amount in combination with the other features of claim 1. The non-sliding mode control prior art of record does not disclose or teach an actuator control apparatus where the value of a switching function is stipulated by a linear function that is made based at least on the deviation to converge on zero in combination with the other features of claim 9. As applicant states in the response of 12/20/2005, "These features are otherwise referred to as sliding mode control." In regard to the sliding mode control prior art, the prior art of record does not disclose or teach first and second state values which change according to the action of an actuator wherein there are first and second target values and wherein driving the actuator to make the first state amount converge on an equilibrium point makes the second state value match the second target value as recited in claims 1 and 9.

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Liu et al. 6,046,878 is a sliding mode control apparatus with multiple parameters but it is not a one input, dual output control system as described in applicant's specification and as claimed by applicant.
